GLOWWELL BEAUTY CLINIC

SYSTEM USER GUIDE

Your time to feel good starts here.

A practical guide to booking treatments, managing clinic schedules, and reviewing appointment reports in GlowWell.

Application: GlowWell Beauty Clinic Management System
Edition: Assessment submission · **Audience:** Customers and clinic administrators

Getting started

1. Open the application

GlowWell uses the Apache and MySQL services provided by AMPPS for local development.

Install and configure

1. Keep the project in AMPPS's `www` directory and start Apache and MySQL in AMPPS.
2. Open AMPPS phpMyAdmin, select the `glowwell` database, and import `database/glowwell.sql`. The schema creates the application tables without clinic records.
3. For assessment/testing, also import `database/glowwell_sample_data.sql`. It adds clearly labelled test accounts, staff, treatments, schedules, and example appointments. Skip this step for a clean production database.
4. Open `http://localhost/GlowWell-Website/`. The app uses the local AMPPS MySQL server and reads its root password from AMPPS's `ampps/data/my.conf`.

Assessment logins (test data only): Admin: `glowwell.admin@glowwell.com`; customer: `koketsobelsia@glowwell.com`; password for both: `GlowWellAssess2026!`

For a clean clinic setup, open `http://localhost/GlowWell-Website/` and register your own account. In AMPPS phpMyAdmin, select the `glowwell` database, open the `users` table, choose **Edit** for your account, change its `role` to `admin`, and save. Sign out and back in to see the administrator navigation.

Sign out and back in, then add your actual team members, schedules, and treatments before opening booking to customers. Keep database credentials out of source files. If you imported the assessment dataset, use the bundled assessment accounts below as shown in the sample-data script. Do not edit or add new entries to the sample-data SQL file.

CUSTOMER EXPERIENCE

2. Register and sign in

Create a customer account

1. Select **Create an account** from the home page or **Create an account** under the sign-in form.
2. Enter your name, email address, phone number, and a password of at least eight characters.
3. Confirm the password and select **Create account**. You will be taken to your customer dashboard.

Only an administrator can access the admin area. New public registrations receive the customer role.

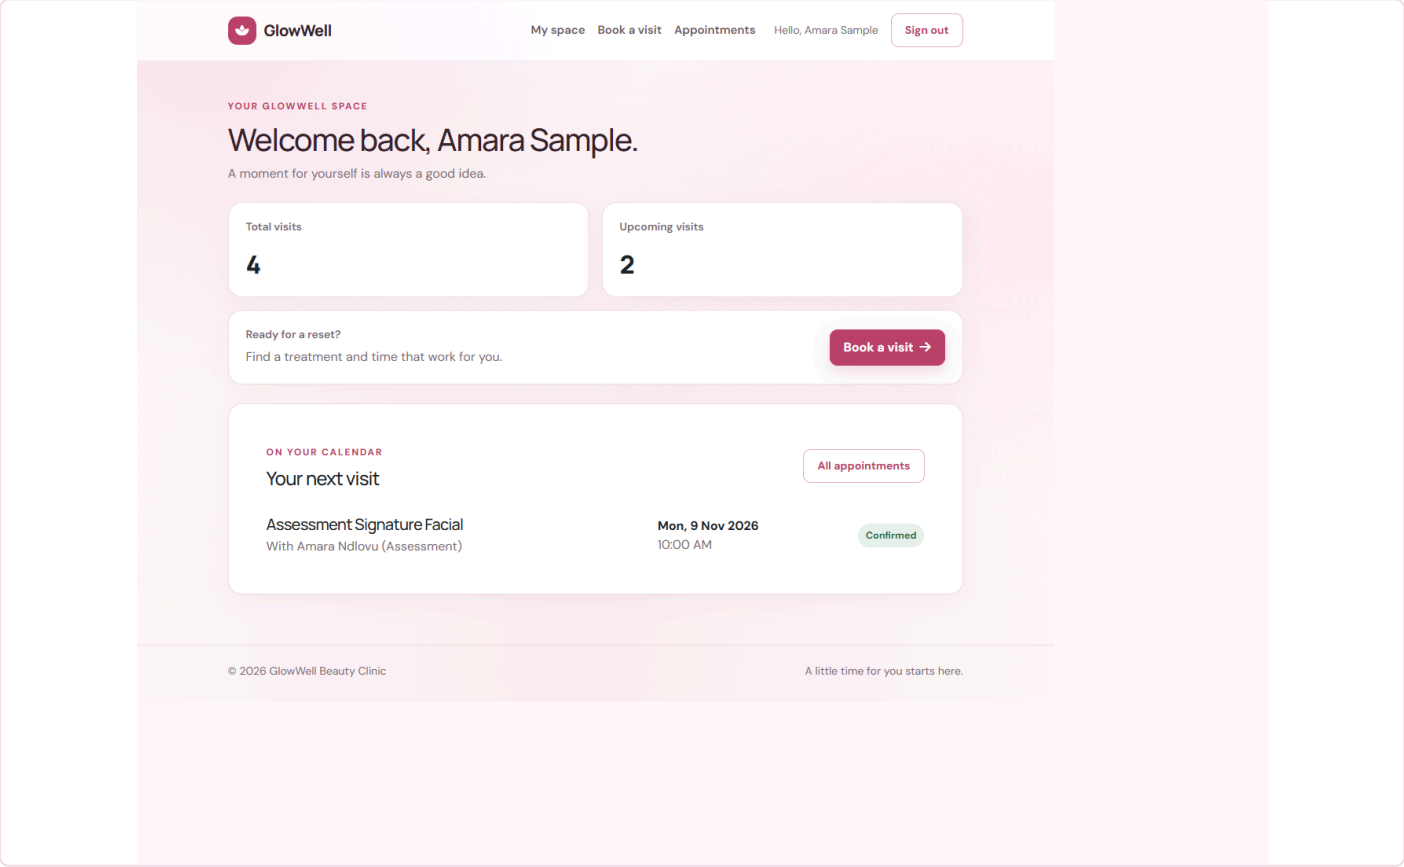

Figure 3. Customer dashboard with visit totals and the next appointment.

3. Book a treatment

1. Sign in and choose **Book a visit**.
2. Select a treatment. The menu shows duration and price.
3. Select an active team member, then choose a date and start time.
4. Select **Confirm appointment**. A success message appears when the booking is saved.
5. Choose **Appointments** to review your bookings and their statuses.

Bookings must fit inside that team member's working hours. The application checks for overlapping appointments for both the team member and the customer, using treatment durations, and checks availability again on the server before saving.

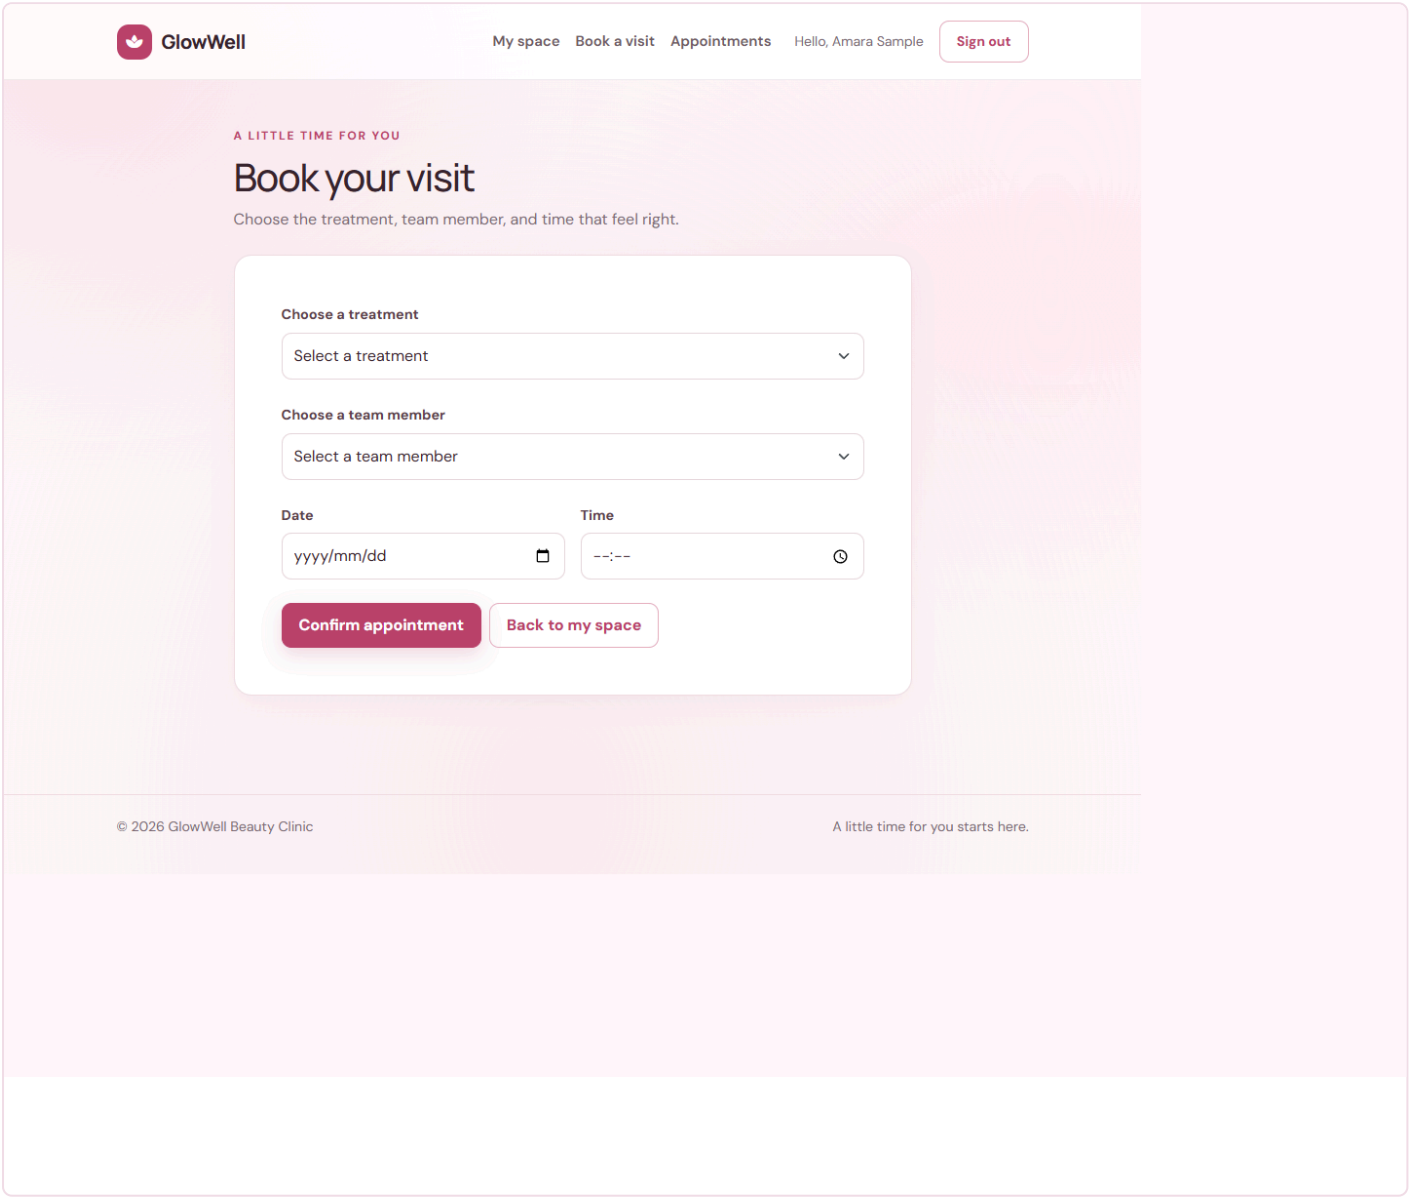

Figure 4. Customer booking form for choosing a treatment, staff member, date, and time.

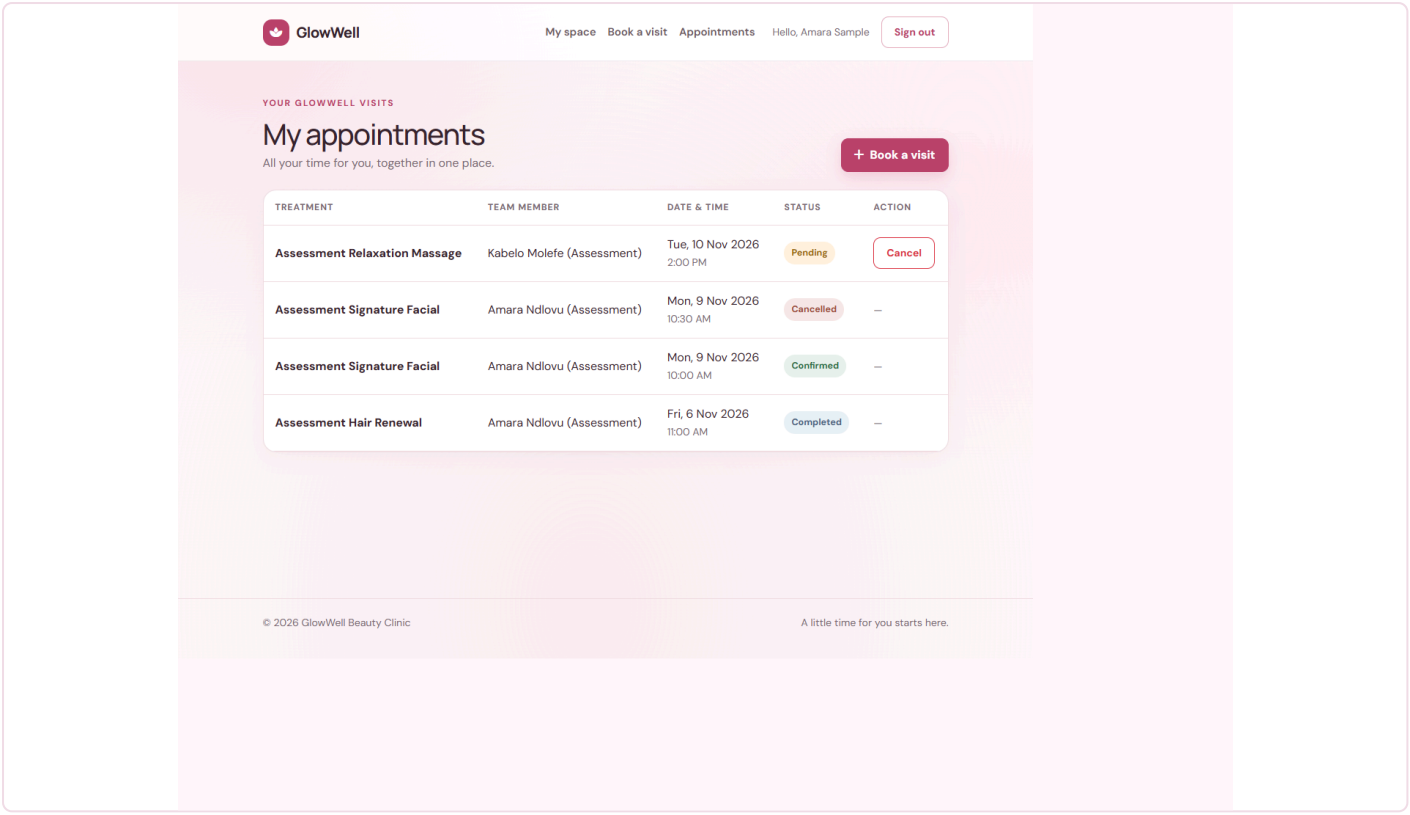

Figure 5. Customer appointment history and pending appointment actions.

Cancel a booking

In **Appointments**, select **Cancel** on an upcoming appointment that is still pending and confirm. Confirmed, completed, cancelled, or past visits cannot be cancelled through the customer screen; contact the clinic if you need help.

Clinic administration

4. Review the clinic dashboard

Sign in with the administrator account to see customer, staff, treatment, and booking totals. The dashboard also shows how many appointments are scheduled today and links to clinic management pages.

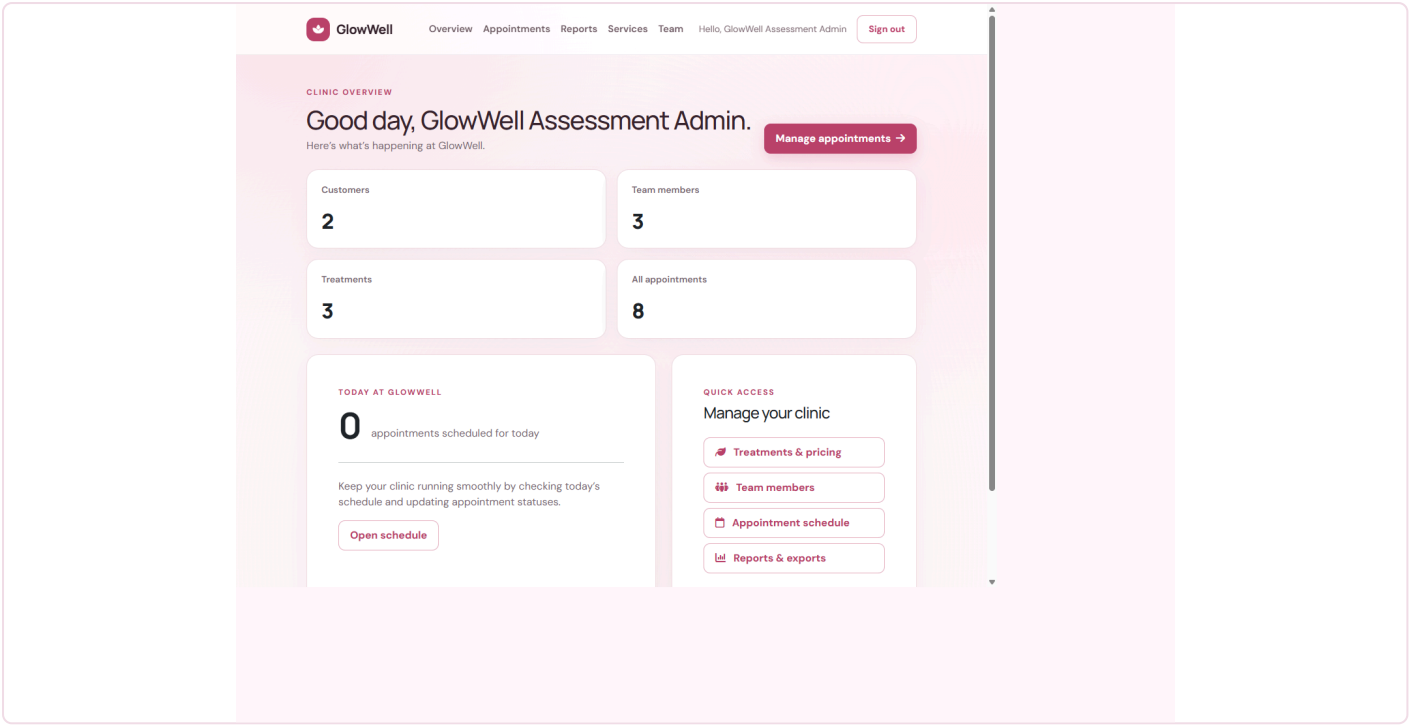

Figure 6. Administrator overview and clinic-management links.

5. Manage the team and weekly schedules

1. Open **Team** in the administrator navigation.
2. Add a team member with a name; phone and speciality are optional. A new active member receives a default Monday-to-Saturday schedule of 09:00–18:00.

3. For each member, tick the days they work, set start and end times, and choose **Save weekly schedule**. Unticked days are unavailable.
4. Choose **Edit** to update contact details or switch the team member between Active and Inactive. Inactive team members cannot be selected for new bookings.
5. Choose **Delete** to remove a team member who has no appointment history. Keep historical records intact by marking a member with past bookings inactive instead.

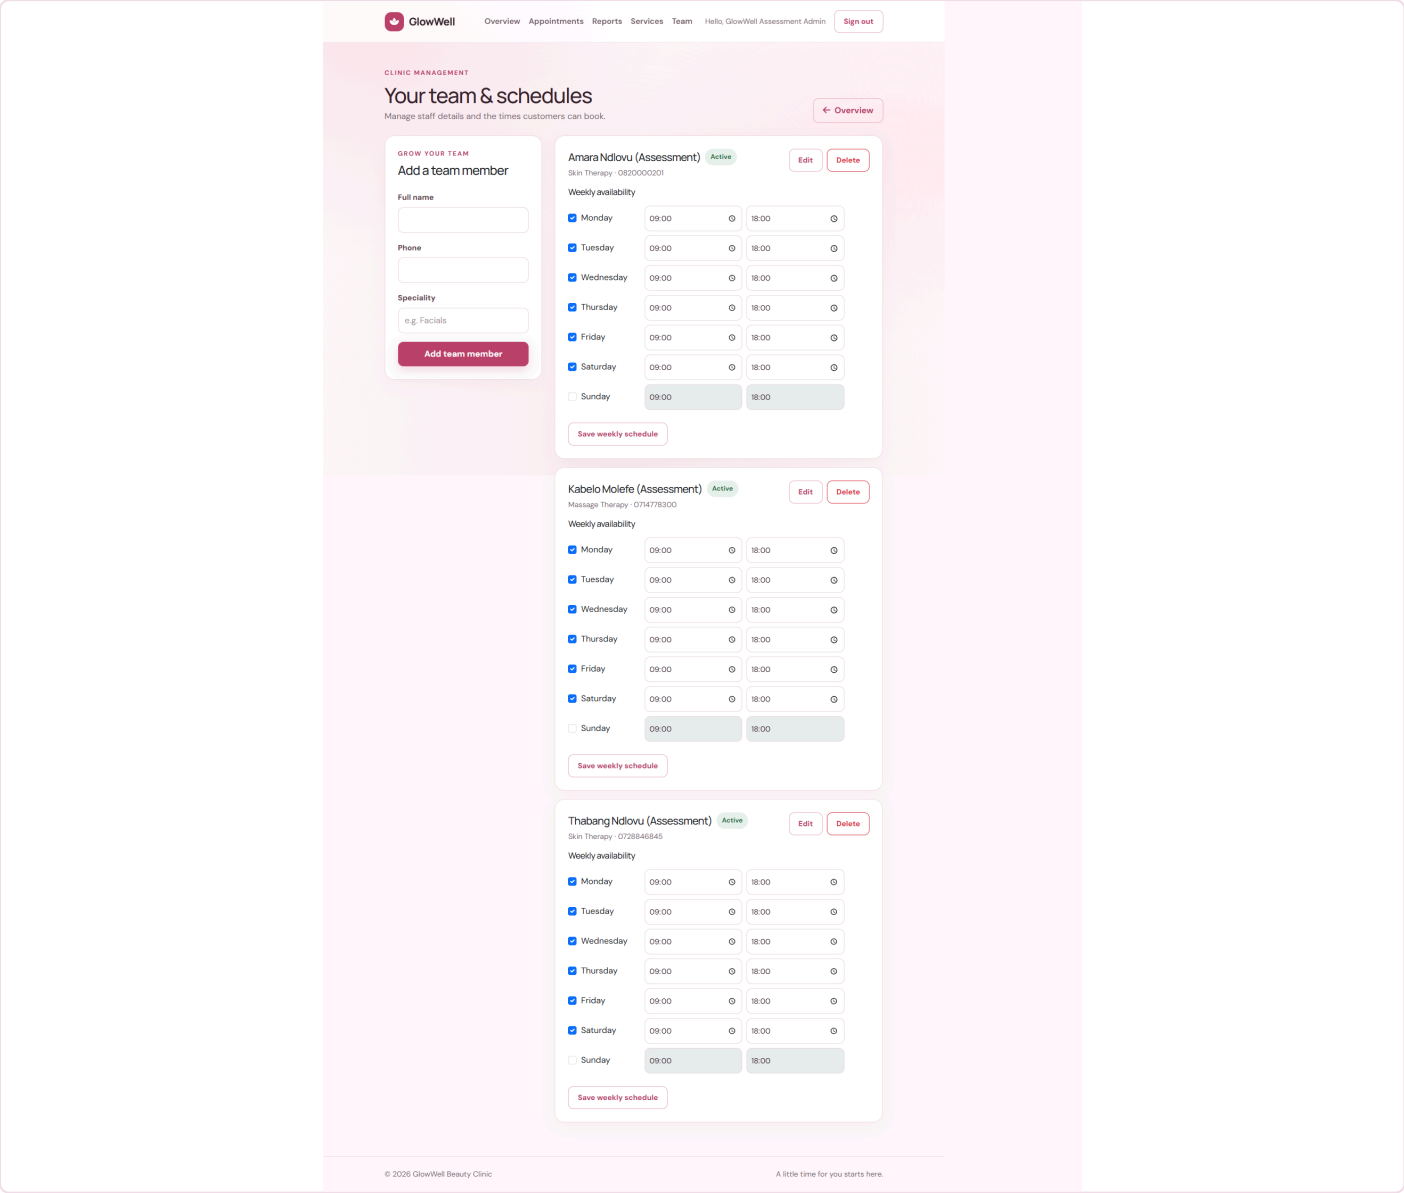

Figure 7. Staff profile management and weekly availability editor.

6. Manage treatments and appointment statuses

From **Services**, add treatments with a positive duration and price; edit existing treatments; or delete a treatment that has no appointment history. Historical treatments cannot be deleted, to protect the booking record.

From **Appointments**, review the customer, treatment, team member, date, time, and status. The normal status flow is **Pending** → **Confirmed** → **Completed**. Pending or confirmed bookings can also be cancelled by the administrator.

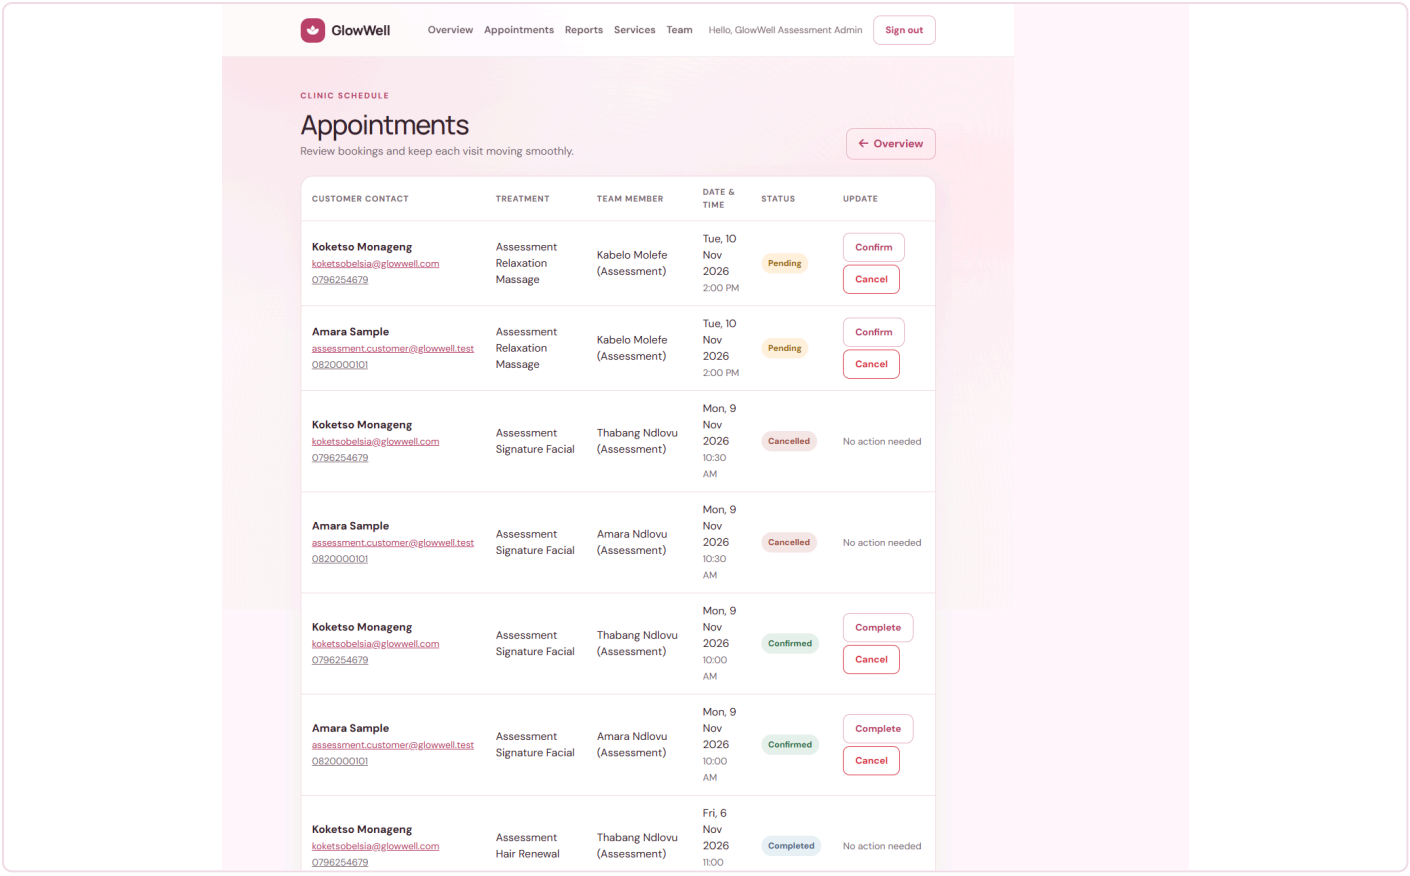

Figure 8. Administrator appointment schedule and status controls.

REPORTS & RECORDS

7. Filter and export reports

1. Open **Reports** from the administrator navigation.
2. Optionally enter a start date, end date, and appointment status.
3. Choose **Apply filters** to view the matching appointment details and summary counts.
4. The completed service value includes completed visits in the current filter.
5. Choose **Download CSV** to save the filtered details for spreadsheet analysis.

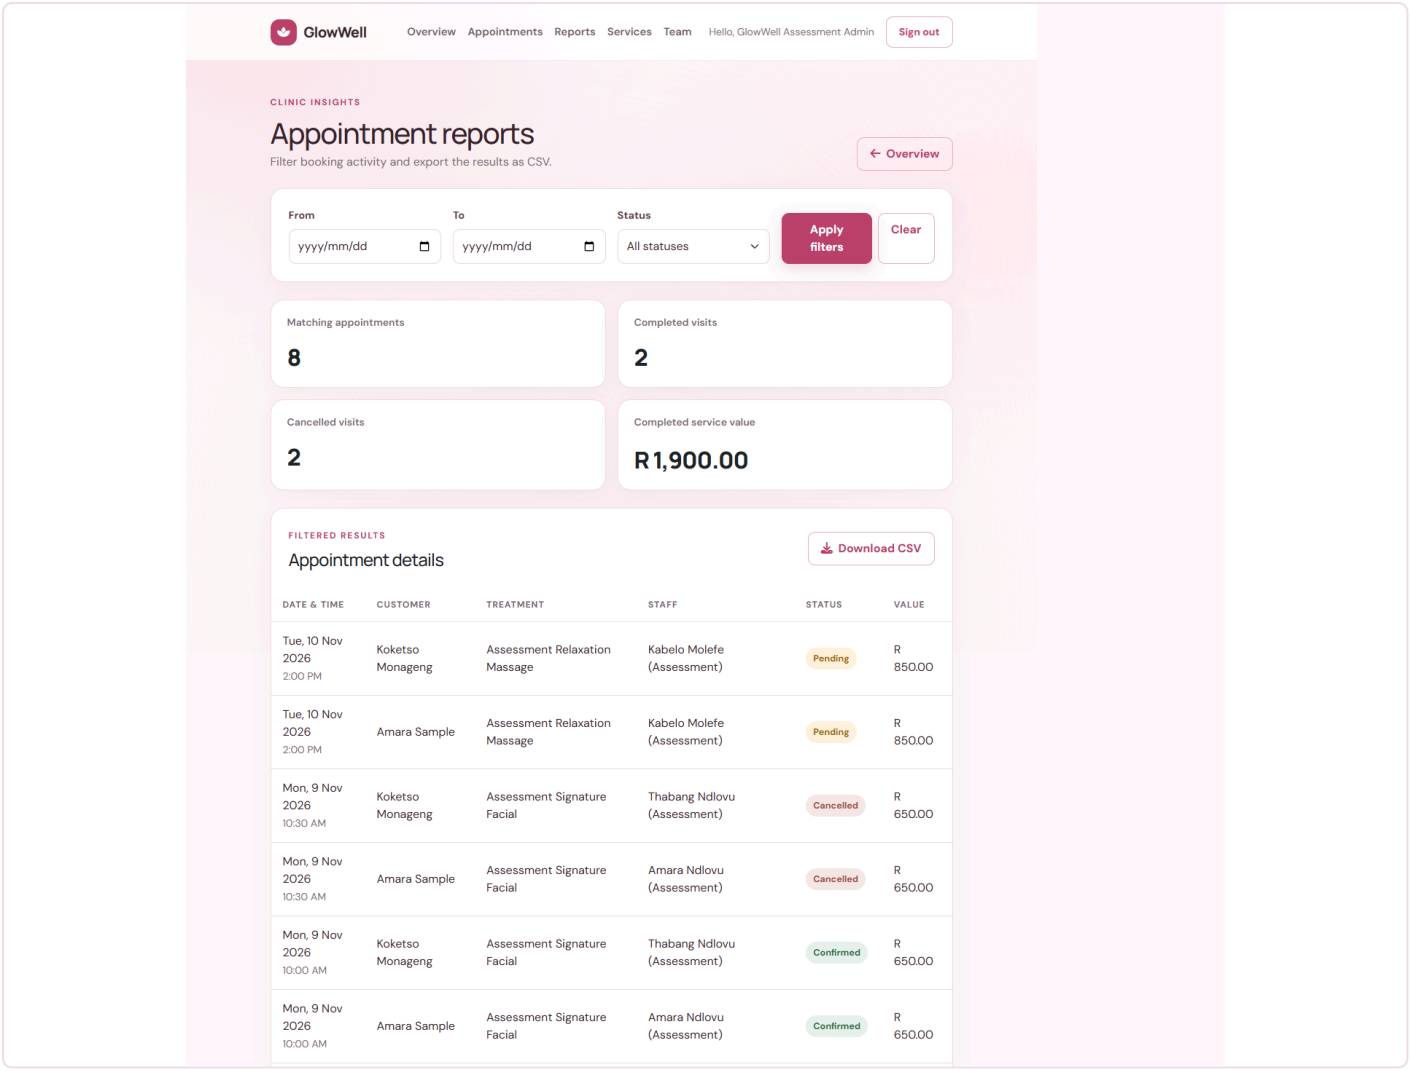

Figure 9. Appointment report, summary metrics, and CSV export.

8. Database tables

The MySQL schema is normalized around these related records. Primary-key IDs identify records; foreign keys keep appointment history linked to the people and services that created it.

users

`user_id INT NOT NULL AUTO_INCREMENT` primary key; required `fullname VARCHAR(100)`, unique `email VARCHAR(254)`, phone `VARCHAR(20)`, and `password VARCHAR(255)` (a password hash); `role ENUM(admin, customer)` defaults to customer; `created_at TIMESTAMP` defaults to the creation time.

staff

`staff_id INT NOT NULL AUTO_INCREMENT` primary key; required `fullname VARCHAR(100)`; nullable phone `VARCHAR(20)` and `speciality VARCHAR(100)`; `status ENUM(Active, Inactive)` defaults to Active.

staff_schedules

`schedule_id INT NOT NULL AUTO_INCREMENT` primary key; required `staff_id INT` foreign key to staff, `weekday TINYINT UNSIGNED` (ISO 1–7), `start_time TIME`, and `end_time TIME`. A staff member has at most one schedule

row per weekday; checks enforce valid weekdays and increasing times. Deleting a staff record cascades to its schedule rows.

services

`service_id INT NOT NULL AUTO_INCREMENT` primary key; required `service_name VARCHAR(100)`, `duration SMALLINT UNSIGNED` in minutes, and `price DECIMAL(10,2)`; nullable `description TEXT`. Checks require positive duration and price.

appointments

`appointment_id INT NOT NULL AUTO_INCREMENT` primary key; required `user_id INT`, `service_id INT`, `staff_id INT`, `appointment_date DATE`, and `appointment_time TIME`; `status ENUM(Pending, Confirmed, Completed, Cancelled)` defaults to Pending. Foreign keys preserve links to customers, services, and staff; indexes support customer/date, team/date, and service lookups.

9. Safety and troubleshooting

- Database passwords belong in environment variables, not source files or the submission ZIP.
- If the site cannot connect to MySQL, confirm that AMPPS MySQL is running, `pdo_mysql` is enabled, and the imported database is named `glowwell`. By default, the app reads AMPPS's MySQL password file; custom credentials must be available in Apache's environment.
- To test JavaScript date/schedule feedback, open the booking form, choose a treatment and team member, then select a day/time outside their schedule. Server-side checks still protect every submitted booking.
